Education

2019–2022: University of Cambridge PhD Statistics.

- Supervisor: Rajen Shah. Thesis: Statistical Inference for High-Dimensional Data.
- Areas: high-dimensional statistics, semiparametric statistics, causal inference.
- Working projects:
 - “Average Derivatives as Generalised Linear Coefficients with Plug-in Machine Learning Estimation”. Quantifying the effects of continuous inputs within arbitrarily complex systems. Applicable to personalised medicine, financial modelling and interpretable machine learning.
 - “Conditional Independence Testing for Discrete Data”. Identifying causal relationships between non-continuous variables. Applicable to causal discovery in real-world data.

2018–2019: University of Cambridge MMath Mathematics, distinction.

- Thesis: Statistical Inference using Machine Learning Methods.

2015–2018: University of Cambridge BA Mathematics, first.

2011–2015: Eton College, full scholarship.

Experience

2020–current: Statistical Laboratory, University of Cambridge, Statistics Consultant.

- Advised more than 10 inter-disciplinary projects, including carbon sequestration, psychology and clinical imaging. Weekly voluntary work accelerating applied research.
- Rapidly absorbed complex information, identified task-relevant factors, and devised and communicated solutions clearly and concisely in non-technical language.

2019-2020: Faculty of Mathematics, University of Cambridge, Statistical Modelling and Machine Learning Teacher.

- Taught more than 10 final-year undergraduates, pairwise, both in-person and online.
- Instilled an enthusiasm for the subjects, and clearly explained solutions to difficult problems. One student is subsequently pursuing a PhD in the same group.

Summer 2018: Veterinary School, University of Cambridge, Epidemiology Research Intern.

- Developed 4 mathematical models in R for the epidemiology of a rare transmissible cancer in dog populations, in the absence of previous attempts in the literature.
- Proposed and tested population-mixing as a hypothesis for exceptional disease persistence, which reduced 100-year extinction likelihood by 50%.

Summer 2017: InterContinental Hotels Group, Operational Finance Management Intern.

- Co-ordinated international project team across Stockholm, Berlin and UK.

Prizes and Awards

2021 Faculty of Mathematics and **G-Research** PhD research prizes for “Average Derivatives as Generalised Linear Coefficients with Plug-in Machine Learning Estimation”.

2019–2022 EPSRC, full PhD studentship.

2017–2020 Emmanuel College, Cambridge, 9 academic prizes.

2011–2015 Eton College, full scholarship, plus 2 academic prizes.
